

EMPATHY MAP

Implement Client Script & UI Policy (Incident) — ServiceNow

User perspective: ServiceNow Incident record users

SAYS	THINKS
• “I need to enter the Incident details correctly.” • “The required information should be clear.” • “I need to assign the Incident before saving.”	• “What fields are required for a high-impact Incident?” • “Will the system prevent incorrect data?” • “Why can't I edit State directly from the list?”
DOES	FEELS
• Creates and updates Incident records. • Changes Impact and other Incident fields. • Attempts to save records. • May edit State from the Incident list.	• Frustrated by incomplete or inconsistent data entry. • Confident when the system guides validation. • Concerned when an Incident cannot be saved or edited as expected.
PAIN POINTS	NEEDS / GOALS
• Incomplete or incorrect Incident data. • Manual checking can cause inconsistency. • Incorrect submissions can affect reporting, SLA compliance and service quality. • Unauthorized State changes through list editing.	• Clear conditional field behavior. • Mandatory fields when required. • Automatic urgency setting for High Impact. • Validation before saving. • Controlled State changes and consistent Incident records.

Project focus: Improve Incident data integrity and consistency using UI Policies and Client Scripts that control field behavior, automate updates, validate submissions, and restrict inappropriate list edits.
